Graphite/Carbon
Packing
(Qty. 6)

Ranger is proud to now offer the 48 Series Quad Lip Seal. The Quad Seal gives zero leakage similar to the mechanical seal, and if and when the two double lip seals wear out, the backup packing can be tightened down to obtain zero leakage and continue pumping. The double lip seals, unlike the mechanical seal, can combine to perform when seals wear out. The double lip seals are made of Teflon with a Viton O-Ring. The double lip seal has a maximum temperature of 400°F. The Flexible Graphite packing is designed to run dry until needed with no added lubricants or binders to cook out or become brittle. The Flexible Graphite packing has a maximum temperature of 750°F.
